

SPACE™ FRP LOUVERS

Lighting & Air Ventilation

SPACE™ Louvers improve interior daylighting and perform the important function of ventilation and air flow in buildings. It can also provide architectural style to building designs.

While our louvers provide fresh air intake and exhaust, it allows natural daylight into buildings to enhance the level of lighting. Reducing the need for artificial lighting is a logical method to save energy costs and the environment.

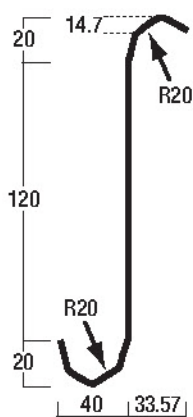

Suitable for most buildings and applications.

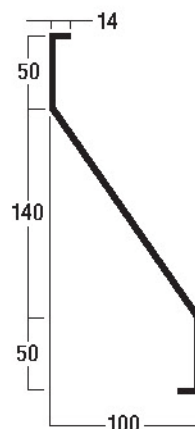

Existing Profiles

SPACE™ Louvers can add extraordinary and appealing features to exterior and interior facade.
